PREFACE

This report presents the results of a comprehensive study of the Chinese Communist aircraft industry based on photographic interpretation of both airframe and aircraft engine production facilities. The plants are described separately in the report; for comparison purposes, perspective drawings of the various test facilities at the plants are presented together in a separate section. The plants included in this report may not constitute the entire Chinese Communist aircraft industry; however, an extensive search of photography of the Chinese mainland from indicates that at least the greater part of the industry is included here. This report has been prepared as project C-1782/63 in response to CIA requirement number C-DI3-80,867.

25X1D

SUMMARY

The Chinese Communists, with technical assistance from the USSR and the European Satellites, began development of a domestic aircraft industry in the early 1950s. The first facilities for aircraft production were developed by rehabilitating and expanding older facilities previously utilized as aircraft repair and maintenance depots a The installations at Shen-yang, Nan-chang, and Peiping were converted to production facilities in this way. The Chu-chou Aircraft Engine Plant was probably converted from a World War II arsenal.

During this period of rehabilitation and expansion, the Chinese Communists apparently realized that additional and more modern facilities would be needed to supply their future aircraft needs. The importance which the Chinese Communist regime attaches to the aircraft industry is apparent from the ambitious program they have initiated for the construction of new and modern aircraft plants. The Ha-crh-pin Aircraft Engine and Airframe Plants and the Ku-tien-tzu Aircraft Assembly and Repair Plant were probably the first totally new

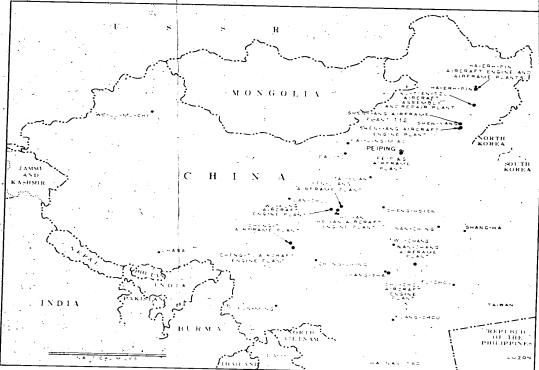

FIGURE 1. LOCATION MAP OF PRINCIPAL INSTALLATIONS OF THE CHINESE COMMUNIST AIRCRAFT INDUSTRY.

25X1G

aircraft plants constructed in China. The construction program was well under way by 1959, with airframe plants under construction at Cheng-tu and Yen-liang, and aircraft engine plants under construction at Cheng-tu, Hsi-an, and Wu-kung.

25X1C

Table 1 presents a summary of current intelligence, derived from photography, concerning the construction status, operational status, floorspace, and expansion of each installation.

Ku-tien-tzu Aircraft Assembly and Repair Plant, designated in the 1Dlas Chi-lin Air Force Repair Base Ku-tien-tzu, is located adjacent to the Ku-tien-tzu Airfield 11.5 nm northwest of Chi-lin (Figures 1 and 6). The plant is served by both road and rail. When first photographed on the installation was identified as

the installation was identified as an aircraft assembly and repair plant, containing approximately 731,400 square feet of floorspace.

Later photography, from showed to apparent change in facilities or floorspace at the plant. The presence of airframe crates and smaller component crates in the plant area indicates that the plant probably assembled aircraft from shipments received from the Soviets.

The plant appears to be a major repair facility for both airframes and aircraft engines;

this interpretation is supported by the large number of aircraft observed at the airfield and on the parking ramp adjoining the plant. The repair of aircraft engines is evident from the presence of an engine test building and an aircraft test revetment. The engine test building item 6, Figure 7 and Table 4) has three projecting wings, two housing single test cells and one housing a double test cell (Figure 31). One wing includes a control and instrumentation section.

The adjacent Ku-tien-tzu Airfield has a northeast southwest concrete runway measuring 6,400 by 200 feet. The runway is served by a full-length parallel taxiway with four crossovers and numerous hardstands and parking/assembly aprons. Repair hangars are also present at the airfield. At the time of

FAGOT FRESCO and 3 BEAGLE were visible at the airfield.

Nan-chang Airframe Plant, designated in the TDI as Nan-chang Aircraft Repair and Assembly Plant, is located adjacent to the Nan-chang New Airfield 3.5 nm southeast of the center of Nan-chang (Figures 1 and 8). The plant is served by both road and rail.

This plant was identified as an aircraft repair and maintenance depot when first photographed in Later photography of the plant, from

25X1D 25X1D

25X1D

shows that the installation contained approximately \$69,975 square feet of floorspace at that time and was capable of assembly as well as repair and maintenance of aircraft. A comparison of photography from

25X1D 25X1D

shows additions

containing approximately 230,025 square feet of floorspace, which increase the plant's total floorspace to approximately 1,100,000 square feet (Figure 9 and Table 5). The additions indicate that it is now possible for the plant to fabricate airframes.

The adjacent Nan-chang New Airfield has a northeast southwest concrete runway, which has been extended from 5,000 feet in to its present dimensions of 7,000 by 230 feet. The runway is served by two crossovers and two taxiways, which connect the runway to a parking ramp adjoining the airfield in (Figure 8).

FIGURE 12. SHEN-YANG AIRFRAME PLANT 112

25X1D

SHEN YANG AIRFRAME PLANT 112, SHEN YANG, CHINA

25X1A 25X1A

Shen-yang Airframe Plant 112 is located adjacent to Shen-yang Airfield North

4 nm north-northeast of the center 25X1A of Shen-yang (Figures 1 and 12). The plant was formerly known as the Shen-yang Aircraft Manufacturing Company Plant No 2. It is served

by both road and rail.

This installation, when first observed on World War II prestrike, strike, and poststrike photography, was an aircraft repair and maintenance depot containing approximately 361,640 square feet of floorspace. This photography indicates that little or no damage had resulted from aerial bombardment. Photography of

25X1D 25X1D

reveals that the original aircraft been expanded into a modern plant, capable of fabricating and assembling aircraft in addition to performing repair and maintenance. The expansion increased the total floorspace to approximately 1,586,340 square feet.

25X1D 25X1D

25X1D 25X1D comparison of photography from with that of

shows that considerable construction activ ity had taken place during this interval, which

increased the plant's total floorspace to approximately 1,962,730 square feet (Figure 13 and Table 7). Additions since a subsonic wind tunnel and a gas dynamics facility consisting of a possible superspnic wind tunnel and a battery of 15 pressurized tanks, with bases available for nine additional tanks (Figure 26). More recent photography of the

irframe plant, from

no apparent change in facilities or tiporspace; some construction activity is evident however, on the taxiway at the adjacent airfield

Shen-yang Airfield North has a north/south concrete runway, which has been extended from to its present dimen- 25X1D 6,600 feet in sions of 4,400 by 280 feet. The runwar is served by four crossovers, one of which is under construction, and by a parallel taxiwar which is being extended to the north. Repair facilities, parking and assembly aprons, and an aircraft test revetment (Figure 36) are also located at Nine FARMER, ore FAGOT, the airfield. FRESCO, and one MOOSE MAN we're observed at the airfield in

Blk as Hsi-an Airframe Plant Yen-liang Airfield, is located adjacent to the Yen-liang Airfield 22 nm north-northeast of Hsi-an, China (Figures 1 and 14). The plant and the airfield are served by both road and rail.

25X1D The airframe plant was first observed under construction on 25X1D Figures 14 and 15). The buildings completion in 25X1D pleted or nearing completion in 25X1D

pleted or nearing completion in tain approximately 1,470,275 square feet of floorspace; the buildings that were then in early or partial stages of construction will contain an additional estimated 1,068,800 square feet of floorspace when completed (Table 8). 1

25X1D show no apparent change in facilities or construction status since indicating that the construction

of this plant is at a standstill.

There does not appear to be a final assembly hall sufficiently large for the production of aircraft of greater than fighter size; however, ample space is available at the plant for such a structure.

The adjacent Yen-liang Airfield will probably serve the plant as a test and flyaway field. The airfield has a northeast/southwest concrete runway measuring 8,400 by 230 feet and a full-length parallel taxiway with five crossovers. A firing-in butt and three repair hangars are located at the airfield. At present there is no indication of a connecting taxiway between the airframe plant and the airfield. The alignment of this taxiway would depend on the altimate location of the final assembly hall. Two COLT and two FAGOT FRESCO were observed at the airfield in

25X1D

AIRCRAFT ENGINE PLANTS

CHENG-TU AIRCRAFT ENGINE PLANT, CHENG-TU, CHINA

25X1A

(30-40N 104-04E)

Cheng-tu Aircraft Engine Plant is located 2.5 nm east-southeast of the center of Chengtu, within the Cheng-tu industrial complex (Figures 1 and 16). The plant is enclosed by a wall and is served by both 25X1D approximately road and rail.

25X1D 25X1D

When first observed on photography of the aircraft engine plant was under construction and contained approximately 1,647,575 square feet of floorspace. A comparison of phowith that of shows additions of approxi-

25X1D 25X1D 25X1D tography of mately 1,046,450 square feet of floorspace, inereasing the plant's floorspace to approximately 2,694,025 square feet. Three new buildings were under construction at the time of (Figure 16); upon completion these buildings will increase the floorspace of the plant to approximately 3,000,000 square feet. The installation appears to be in the final stages of construction.

The engine test facilities are housed in the test building (item 1, Figure 17 and able 9). This building has four projecting wings, two containing double test cells and two centaining single test cells. One wing include a control and instrumentation section. The four cells are served by individual exhaus towers (Figure 27).

FIGURE 18. CHU-CHOU AIRCRAFT ENGINE PLANT

25X1D

CHU-CHOU AIRCRAFT ENGINE PLANT, CHU-CHOU, CHINA

(27-49% (10-08E)

Chu-chou Aircraft Engine Plant is located - on the east bank of the Hsiang Chiang criver, 3 nm southeast of the center of Chu-chou The plant is served by (Figures 1 and 18). both road and rail.

25X1D 25X1D 25X1D 25X1C

25X1D

When first observed on

the plant contained approximate 779,500 square feet of floorspace. A compariphotography with that of on of the

shows 🔃 substantial increase in floorspace in the original installation (Area A, Figure 19), amounting to approximately 220,500 square feet, as well as the construction of a new area (Area B, Figure 19) adjoining the north side of the main plant area. This new area, which contains an additional 215,800 square feet of floorspace, appears to be associated with the aircraft engine plant, since

its only access lies through the plant area contains a three-story laboratory, an assembly machine shop under construction, workshops or machine shops, two drive-hrough buildings, and five well dispersed storage; processing buildings. Three of the storage processing buildings are constructed on aprons, possibly concrete, which suggests the handling of a corrosive-type substance. This area is served by a drainage system and an und rground water reservoir, possibly for the flashing of spillage or waste.

The engine test facilities are housed in the test building (item 1, Figure 19 and Table 10). this building has three projecting vings, two containing single test cells and one containing a double test cell. The three wings are served by individual exhaust towers (Figure 28).

Shen-yang Aircraft Engine Plant and the 25X1A adjacent main plant of Shen-yang Arsenal 90th (41-47N 123-29E) cated next to the Shen-yang Airticla: hutheast in the Ta-tung ward of Shen-yang (Figures 1 and 22). Both of these plants are apparently involved in the production of aircraft engines and will be considered together in this report as the Shen-yang Aircraft Engine Plant. The installation is served by both road and rail. '

The Shen-yang Aircraft Engine Plant was

first observed in on World War II prestrike, strike, and poststrike photography. This photography shows that damage caused by the aerial bombardment of this plant was not extensive, although some 25X1D plant from

plant from 25X1D plant from that a complete rehabilitation had been affected

and that newer buildings had replaced some of the older facilities: The first indication of a connection between the original sircraft engine plant and the main plant of Sher-yang Arsenal 90th appeared on

when aircraft engine test facilities were observed within the plant area of the arsenal fitems 18 and 36, Figure 23 and Table (2). At the time the latest photography, from

the installation contained approxi- 25X1D mately 4,065,520 square feet of floorspace.

Virtield Southeast The adjacent Shen-yang oncrete runway has a northeast southwest measuring 6,750 by 275 feet. The runway is served by a full-length parallel taxiway with four crossovers and several barking assembly aprons. Repair facilities are also located at this airfield. Photography from shows a dismantled FARMER

a CAB, and two COLT at the arrield (Figure 22).

Wu-kung Aircraft Engine Plant, designated in the BE as Hsj-an Airframe Plant Wu-kung Airfield, is located adjacent to the Wu-kung Airfield

9.2 nm east-south-airfield light for the center of Wu-kung I igures I and 24);

east of the center of Wu-kung I igures I and 24);

The plant is served by both road and rail.

The area now occupied by the aircraft engine plant was first observed in at that time construction of the plant had not yet begun.

plant under construction and containing approximately 546,975 square feet of floorspace. Photography from

shows the addition of several buildings, containing approximately 183,330 square feet of floor-space. A comparison of photography from with that from

reyeals a new building under construction (item 7, Figure 25, and Table 13), which will contain approximately 40,500 square feet of floorspace when completed, a second large building (size undetermined) under construction (item 12, Figure 25 and Table 13),

and an area of construction containing at least five new buildings (item 20, Figure 25). The plant now contains approximately 770, 805 square feet of floorspace. Its location adjacent to the Wu-kung Airfield and the large area available for expansion could indicate the fiture construction of an airframe plant here.

The engine test facilities are housed in the test building litem 1. Figure 25 and Table 13). This building has four projecting wings, two containing double test cells and two containing single test cells. One wing includes a control and instrumentation section. The four test cells are served by individual exhaust towers (Figure 35).

Wu-kung Airfield has an east-west concrete runway measuring 8,200 by 250 feet. The runway is served by a full-length parallel taxiway with four crossovers and numerous hardstands and parking 'assembly aprons. Two BADGER Figure 24), 11 BULL, and 24 MOOSE / MAN were observed at the airfield in

TEST FACILITIES

WIND TUNNEL AND GAS DYNAMICS FACILITY

The wind tunnel and the gas dynamics facility shown in Figure 26 are located at Shenyang Airframe Plant 112. Both appear to be in the final stages of construction and are not yet capable of operation. Other facilities may be added to enhance research capabilities in the field of aerodynamics at the Shen-yang plant.

The wind tunnel, a subsonic continuous-flow type, consists of a control, instrumentation, and laboratory section (A), a first diffuser (B), a

power section (C), a second diffuser (P), a settling section (E), a contraction section (F), and a test section (G).

The gas dynamics facility consists of a building (H) which possibly houses at least one supersonic wind tunnel, and a battery of 15 spherical storage tanks, with bases available for nine additional tanks. Each tank has a diameter and a volume of

25X1D 25X1D 25X1D

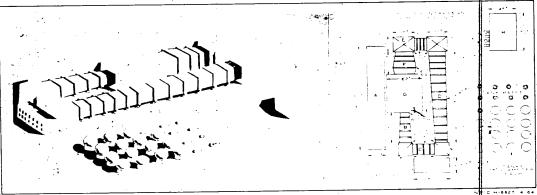

FIGURE 26. PLAN AND PERSPECTIVE VIEWS OF WIND TUNNEL AND GAS DYNAMICS FACILITY, SHEN-YANG AIRFRAME

ENGINE TEST BUILDINGS

The aircraft engine test buildings and the fuel storage, blending, and control stations have been two key features in the identification of aircraft engine plants in Communist China. The engine test buildings, with the exception of those shown in Figures 33 and 34, are of the same basic design; however, since these buildings vary

somewhat in size, configuration, stage of construction, and the number and type of test cells, they will be described separately.

The engine test building at the Cheng-tu Aircraft Engine Plant (Figure 27) appears to be in the final stages of construction. The building consists of a base wing for engine servicing

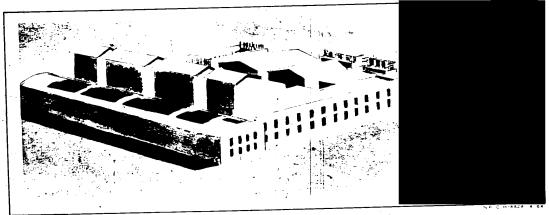

FIGURE 27. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, CHENG TU AIRCRAFT ENGINE PLANT.

and inspection, and four projecting wings. Two of the wings house single U-type test cells and two house double U-type test cells. One wing includes a control and instrumentation section.

The engine test building at the Chu-chou Aircraft Engine Plant (Figure 28) appears to be complete. The building consists of a base wing, used for engine servicing, inspection, control, and instrumentation; and three projecting wings. Two of the wings house single U-type test cells; the third houses a couble L-type test cell. The two U-type test cells were converted from L-type cells after

25X1D

ILLEGIB

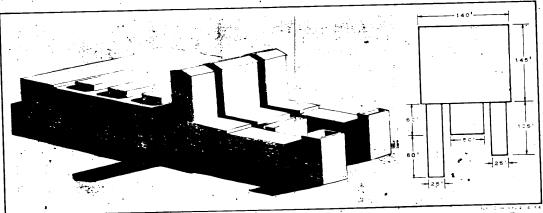

FIGURE 28. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, CHU CHOU AIRCRAFT ENGINE PLANT.

The engine test building at the Ha-erh-pin Aircraft Engine Plant (Figure 29) appears to be complete. The building consists of a base wing for engine servicing and inspection; and four

projecting wings housing single U-type test cells; one wing includes a control and instrumentation section.

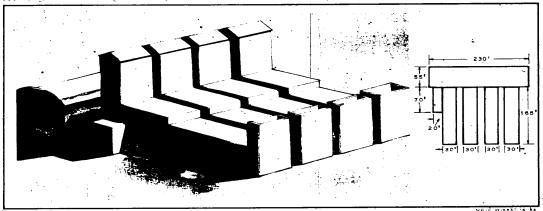

FIGURE 29. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, HA-ERH-PIN AIRCRAFT ENGINE PLANT.

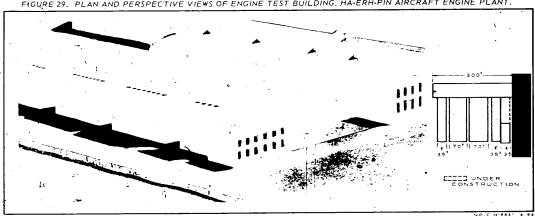

FIGURE 30. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, HSI-AN AIRCRAFT ENGINE PLANT.

The engine test building at the Hsi-an Aircraft Engine Plant Figure 30 appears to be nearing completion. The building consists of a base wing for engine servicing and inspection.

and four projecting wings. Two of the wings house single U-type test cells, and two house double U-type cells. A control and instrumentation section is being added to one of the wings.

ILLEGIB

The engine test building at the Ku-tien-tzu Aircraft Assembly and Repair Plant (Figure 31) appears to be complete. The building consists of a base wing for engine servicing and in-

spection, and three projecting wings. Two of the wings house single L-type test ceils, and one houses a double L-type cell. One wing includes a control and instrumentation section.

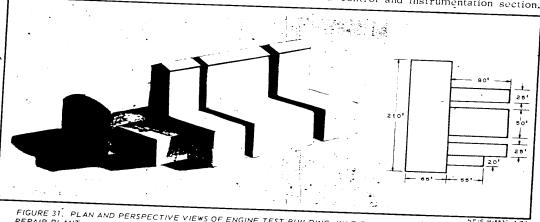

FIGURE 31. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, KU-TIEN-TZU AIRCRAFT ASSEMBLY AND REPAIR PLANT.

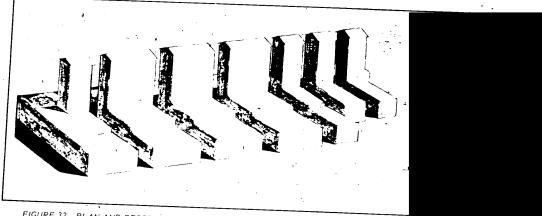

FIGURE 32. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, ITEM 36, SHEN-YANG AIRCRAFT ENGINE PLANT. See Figure 23 and Table 12.

The engine test buildings at the Shen-yang Aircraft Engine Plant are shown in Figures 32, 33, and 34. The building snown in Figure 32 appears to be complete; it consists of a base wing

for engine servicing and inspection, and seven projecting wings. Three of the wings house double L-type test cells, and three house single L-type cells. The seventh wing contains a single

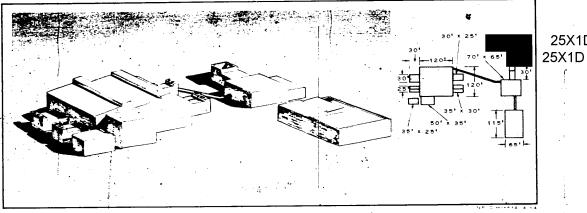

FIGURE 33. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, ITEM 18, SHEN-YANG AIRCRAFT ENGINE PLANT. See Figure 23 and Table 12.

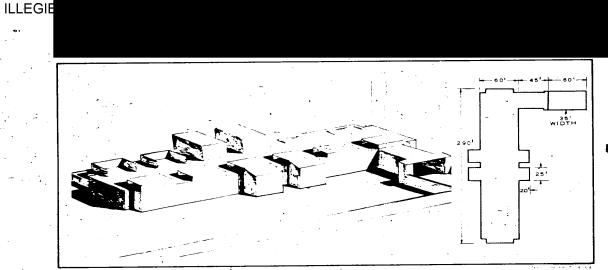

FIGURE 34. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING TEM 50 SHEN-YANG AIRCRAFT ENGINE PLANT. See Figure 23 and Ten e 12

The engine test building shown in Figure 34 is one of the original buildings of the Shen-yang Aircraft Engine Plant. Currently undergoing modification, the rectangular building contains six through-type test cells. One of the cells has been extended, and an enclosed, possibly concrete blast appron now serves the cell.

The engine test building at the Wu-kung

Aircraft Engine Plant (Figure 35) appears to be complete. The building consists of a base wing for engine servicing and inspection, and four projecting wings. Two of the wings house double L-type test cells, and two house single L-type cells. One wing includes a control and instrumentation section.

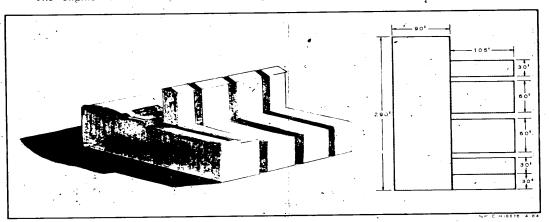

FIGURE 35. PLAN AND PERSPECTIVE VIEWS OF ENGINE TEST BUILDING, WU-KUNG AIRCRAFT ENGINE PLANT.

AIRCRAFT TEST REVETMENTS

The aircraft test revetment represented in Figure 36 is located at Shen-yang Airframe Plant 112; similar test revetments exist at Cheng-tu Airframe Plant, Ha-erh-pin Airframe Plant, Ku-tien-tzu Aircraft Assembly and Repair Plant, and Nan-chang Airframe Plant. The revetment at Shen-yang Airframe Plant 112 is the largest of these and is capable of testing two aircraft simultaneously. The others appear to be single units.

The revetments are constructed of banked earth and appear to be finished with soil sta-

bilizer or a similar hard-surface meterial. The inner rear banks are protected by blast walls or blast deflectors; the large revetment at Shen-yang utilizes a deflector and has a blast wall which divides the revetment into two areas (Figure 36). The revetments are served by concrete aprons and control or instrumentation buildings.

The exact purpose of these test revetments is not known, but it is believed that they serve to abate noise during the measurement and calibrations of the performance of aircraft engines.

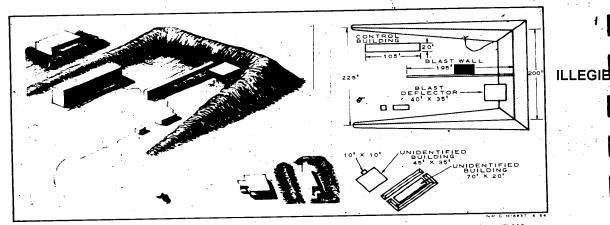

FIGURE 36. PLAN AND PERSPECTIVE VIEWS OF AIRCRAFT TEST REVETMENT, SHEN-YANG AIRFRAME PLANT 112.

FUEL STORAGE, BLENDING, AND CONTROL STATIONS

Fuel storage, blending, and control stations are located at all Chinese Communist, aircraft engine plants except the plant at Chu-chou. They are of three basic types (Figures 37,441). Both Type 1 (Figure 37) and Type 2 (Figure 38)

are found at the Shen-yang Aircraft Engine Plant. Type 3 is shown in three separate stages of construction: the first stage (Figure 39) is found at the Ha-erh-pin Aircraft Engine Plant, the second stage (Figure 40) is found at the

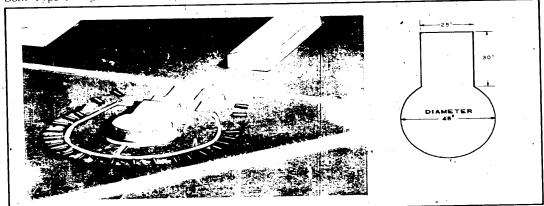

FIGURE 37. PLAN AND PERSPECTIVE VIEWS OF FUEL STORAGE, BLENDING, AND CONTROL STATION, TYPE I, SHEN-YANG AIRCRAFT ENGINE PLANT.

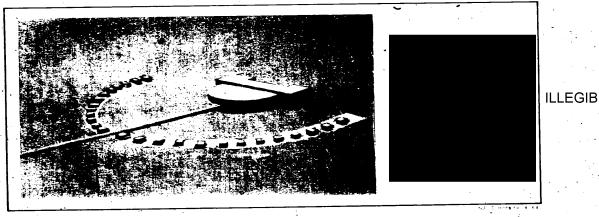

FIGURE 38. PLAN AND PERSPECTIVE VIEWS OF FUEL STORAGE, BLENDING, AND CONTROL STATION, TYPE 2, SHEN-YANG AIRCRAFT ENGINE PLANT.

Hsi-an Aircraft Engine Plant, and the completed facility (Figure 4) a is found at the Cheng-tu Aircraft Engine Plant. The third type of station is also located at the Ku-tien-tzu Aircraft Assembly and Repair Plant and at the Wu-Kung

Mirerait Engine Mant.

trach station consists of a blending and control building and a semicircular arrangement of underground horizontal fuel storage tanks. The stations are served by pipelines

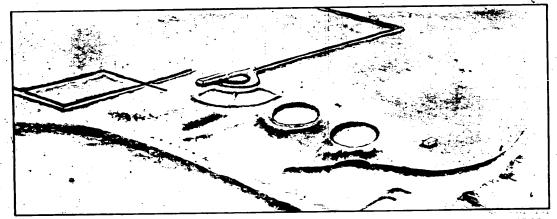

FIGURE 39. PERSPECTIVE VIEW OF FUEL STORAGE, BLENDING, AND CONTROL STATION, TYPE 3, IN FIRST STAGE OF CONSTRUCTION, HAJERH-PIN AIRCRAFT ENGINE PLANT.

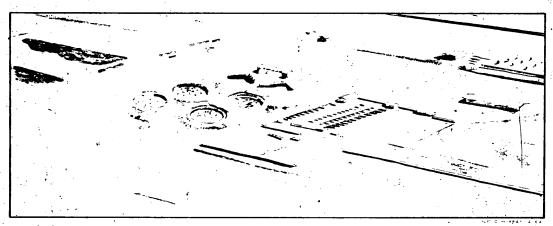

FIGURE 40. PERSPECTIVE VIEW OF FUEL STORAGE, BLENDING, AND CONTROL STATION, TYPE 3, IN SECOND STAGE OF CONSTRUCTION, HSI-AN AIRCRAFT ENGINE FLANT.

from railroad loading and unloading points. The chief difference between Type 1 and Type 2 is in the configurations of the blending and control buildings. Type 3 differs from Type 2 in having four large underground fuel storage tanks in addition to the horizontal tanks.

Although the exact function of these stations is unknown, it is believed that they serve to blend fuels and control the flow of fuels to the nearby engine test buildings, to which they are apparently connected by underground pipelines.

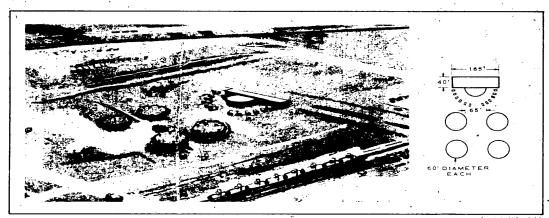

FIGURE 41. PLAN AND PERSPECTIVE VIEWS OF COMPLETED FUEL STORAGE BLENDING, AND CONTROL STATION, TYPE 3. CHENG-TU AIRCRAFT ENGINE PLANT.
